Before starting this tutorial

1. Make sure that you have the following files in your working directory:

   - `multi_subject/data/` : A folder containing 3 subjects, with 6 T2 and MT data files per subject.

   - `multi_subject/process_data.sh` : A script containing SCT commands to process T2 and MT data.

   - `multi_subject/config.yml` : A config file containing input arguments for `sct_run_batch`.

   You can get these files by downloading data_batch-processing-of-subjects.zip.

2. Open a terminal and navigate to the `multi_subject/` directory:

```
cd {PATH_TO_DOWNLOADED_DATA}/multi_subject
```
